

Fits your freezer. Fits your workflow.

Off-the-shelf single-vial handling from case decision to injection — no chairside processing, no draw supplies, no assembly.

AT A GLANCE · CASE WORKFLOW

Five steps. One visit.

01

ORDER

One vial per case. Ambient shipping in a validated cryo-shipper.

02

RECEIVE & STORE

Transfer to on-site cryogenic storage on delivery. Log lot and expiry.

03

PULL FOR CASE

Confirm indication and lot. Move the vial to point of use.

04

THAW

10–15 min at room temperature. No dilution, no reconstitution.

05

INJECT

Single 1.5 mL intra-articular injection. Discard vial per SOP.

Storage & handling

FORMAT

Single-lot, cryopreserved 1.5 mL vials

STORAGE

On-site cryogenic storage; chain-of-custody logged

THAW

10–15 min at room temperature — no water bath

ASSEMBLY

None — no kit, centrifuge, or draw supplies required

Ordering & inventory

ORDER UNIT

One vial per case — no per-injection consumables

REORDER RHYTHM

Forecast from monthly injection volume

LEAD TIME

Ships in a validated cryo-shipper

LOT TRACKING

Single-lot format simplifies lot-to-case documentation

Interpretation

HOW TO HANDLE THE OPERATIONAL OBJECTION

The most common friction — “We are already set up for chairside biologics” — usually reflects habit, not workflow reality. Reframe: chairside setups add draw, spin, and filter steps to every injection. eCTM removes all of them, replacing a variable per-injection workflow with a fixed single-vial workflow. If the practice has cryogenic storage, they are ready today; if not, EPL can advise on validated on-site options during onboarding.

Off-the-shelf. Single vial. Fits any injection workflow.

One vial per case, no chairside processing, no per-injection consumables. Ordering and inventory collapse to a single line item per case.
