

FOLLOW-UP COMPLETENESS · STUDY RIGOR · BERTONE ET AL. 2026

No horses lost. Follow-up you can defend.

100% follow-up at the 12-week primary endpoint. 98% follow-up at 26 weeks. Eight practices.

Follow-up at the endpoints that matter

12-WEEK PRIMARY ENDPOINT

100%

138 / 138 horses · 0 lost to follow-up

Every enrolled horse was assessed at the pre-specified primary endpoint. No imputation, no censoring, no missing-data adjustment required.

26-WEEK DURABILITY ENDPOINT

98%

135 / 138 horses · 3 lost

Six-month follow-up was completed on 135 of 138 horses — unusually high retention for a real-world pragmatic trial.

SITES · PRACTICES · BLINDING

8

Independent practices · Blinded central review

The result was reproduced across eight independent equine practices, with outcome assessment blinded to treatment allocation.

Why follow-up completeness matters

Zero imputation at the primary endpoint. Missing data at the primary endpoint is the single most common way an efficacy result is discounted. In this trial, there was none — the 12-wk result is a complete-case analysis of every enrolled horse.

Retention held through the durability endpoint. Only three horses were unreachable at 26 weeks. Six-month drop-out rates in comparable equine biologic trials commonly run 15–25%. This trial was 2%.

Third-party biostatistics. The analysis plan was executed by an independent biostatistician, with outcome assessors blinded to treatment allocation. The follow-up numbers are not sponsor-derived.

Reproduced across eight practices. The result is not a single-clinic outcome. Eight independent equine practices contributed cases under a common pragmatic protocol — the exact posture regulators look for when weighing generalizability.

138 horses in. 138 evaluated at 12 weeks. 135 evaluated at 26 weeks.

Equine Performance Labs

Follow-up you can defend in front of Regulatory, a formulary committee, or a tender review.
