

RETURN TO WORK · 26-WEEK ENDPOINT · BERTONE ET AL. 2026

4 out of 5 horses. Back to work at 6 months.

79% of eCTM horses returned to or exceeded their prior performance at 26 weeks — vs. 21% on standard of care.

The 6-month result

eCTM · RETURN TO WORK

79%

returned to or exceeded prior performance at 26 weeks

In treated horses, 79% were back to the same level of work they were doing before the injury — or better — by six months.

STANDARD OF CARE · RETURN TO WORK

21%

returned to or exceeded prior performance at 26 weeks

On clinician-selected standard of care, only 21% of horses had reached that same level of work by 26 weeks.

HOW MUCH MORE LIKELY

2.72×

odds ratio · $p < 0.006$ · Cohen's $d = 2.23$

eCTM horses had 2.72× the odds of returning to prior performance vs. standard of care — a large-effect-size clinical difference.

Visualized side by side

eCTM

1 injection · $n = 91$

79%

Standard of care

Clinician-selected · $n = 47$

21%

Share of horses returning to or exceeding their prior level of work at 26 weeks. Odds ratio 2.72× in favor of eCTM ($p < 0.006$). Cohen's $d = 2.23$ (large effect size), preserved in intent-to-treat and per-protocol analyses.

What owners will ask

“Will my horse actually go back to work?”

In the trial, four out of five horses on eCTM returned to — or exceeded — the level of work they were doing before the injury, six months after a single injection. Individual results may vary.

“Is ‘exceeded’ real, or just ‘returned’?”

The endpoint counts horses who returned to or exceeded their prior performance level. In the eCTM arm, some horses came back at or above baseline; the 79% figure includes both.

“How does that compare to what the vet would normally do?”

The trial compared eCTM head-to-head against the treatment your vet would choose otherwise. On that standard of care, roughly one in five horses reached the

“How many injections does that take?”

One. Every horse in the eCTM arm received a single injection — no repeat doses, no series.

Return-to-work is the endpoint owners care about — and the one this trial delivered.

79% vs. 21% at 26 weeks, in a controlled multicenter trial. One injection.
