

FOR THE TREATING VETERINARIAN · EQUICENTA® CTM

Right horse. Right time. Right frame.

A clinician's quick reference for matching a case to the pragmatic trial population — and recognizing the cases where standard care remains the better call.

RIGHT HORSE

The case in front of you.

- YES** Performance horse with clinician-diagnosed intra-articular pathology
- YES** Return-to-work is the endpoint you and the owner care about
- YES** You would prefer a single-injection regimen over a repeat course
- YES** A prior autologous biologic under-performed or is logistically difficult
- YES** The case fits the trial population (indication, severity, workload)

NOT YET / NOT FOR

Where standard of care still wins.

- NO** Case sits outside the trial population (indication, disease stage, use)
- NO** Food-producing animal — investigational; not intended for this use
- NO** Owner expects a curative or guaranteed outcome
- NO** Extra-articular or non-orthopedic application
- NO** Your clinical judgment favors current standard of care

Disease context

The pragmatic trial enrolled performance horses across a real-world range of clinician-diagnosed intra-articular disease. If the case in front of you would have been a plausible trial enrollee, the evidence base supports the conversation. If the pathology, use-case, or workload sits far outside that population, standard of care is the better first call.

Where evidence is strongest

Cases with moderate disease burden and clinician-selected standard of care as the counterfactual are where the primary endpoint moved. Rescue-subgroup responders (see the rescue one-pager) extend the signal to refractory cases, with the exploratory-subgroup qualifier attached.

What to tell the owner

eCTM is under investigation and not FDA-approved. Present it as a single-injection allograft option with a controlled-trial signal for return-to-work at 26 weeks — not as a cure or a guarantee. Individual results may vary. Do not extend the message to disciplines or indications outside the trial.

Interpretation

HOW TO USE THIS SHEET

Case selection is your call. This sheet is a quick check on whether the case in front of you would have been a plausible trial enrollee — single-injection, off-the-shelf, moderate intra-articular disease with return-to-work as the endpoint. When the answer is yes, the controlled-trial data supports the conversation. When it is no, standard of care is the better first call, and this sheet says so on purpose.

Right horse, right time — or standard of care.

If the case fits the trial population, the evidence supports the conversation. If it doesn't, standard of care is the better call. That posture is the frame.
