

INTERNAL — NOT FOR CUSTOMER USE

ECONOMICS OF THE SWITCH · EQUICENTA® CTM

Sell the outcome, not the vial.

Cost-per-return-to-work reframes the pricing conversation: one injection, one thaw, one clinical result to price against — not a per-vial line item.

RETURN TO WORK

79%

of eCTM horses returned to or exceeded prior performance at 26 weeks.

INJECTIONS PER COURSE

1

Single 1.5 mL intra-articular injection vs. 2–3 injections typical of PRP / APS / ACS courses.

EFFECT SUSTAINED

26 wk

Superiority preserved to 26 weeks — the window when repeat hemoderivative courses would typically be scheduled.

A per-outcome cost frame

The individual line items vary by practice; the structure of the comparison does not. Use this frame in every price conversation.

LINE ITEM	EQUICENTA® CTM	TYPICAL HEMO COURSE
Course construction	One vial, one visit.	2–3 injections, 2–3 visits.
Chairside processing	None — thaw 10–15 min.	10–25 min / visit (draw, spin, load).
Vet chair time / course	One appointment.	× number of injections.
Reorder trigger	One vial per case.	Kit + supplies per injection.

Three value drivers to lean on

- 1 · ONE INJECTION, ONE VISIT**

The largest hidden cost of hemoderivative courses is vet chair time: the draw, chairside processing, and repeat visits stack up across a 2–3 injection course. eCTM removes all of it — one thaw, one intra-articular injection, one visit.
- 2 · OFF-THE-SHELF INVENTORY**

Single-lot, cryopreserved vials — no draw supplies, centrifuges, or kits to keep on hand per case. The practice buys and inventories the product it will actually inject; reorder velocity is one vial per case, easy to forecast.
- 3 · DURABLE OUTCOME PROTECTS COMPETITION VALUE**

Return-to-work at 26 weeks is the metric owners actually pay for. Preserved competition value and fewer re-treatments compound into a materially different per-outcome cost.

Interpretation

HOW TO USE THIS IN A PRICE CONVERSATION

Lead with the outcome, then the course. “We are pricing the 26-week return-to-work result, delivered in a single injection.” Then walk the client through the line-item comparison above — particularly vet chair time and injections per course. Avoid product-brand comparisons (per messaging guide). Keep the frame at the class level: an off-the-shelf, single-dose allograft versus a repeat-course autologous biologic.

One injection. One visit. One outcome to price against.

Reframe the conversation from cost-per-vial to cost-per-return-to-work. The math changes when you count chair time, repeat visits, and durability.
