

Why equicenta™ CTM

Evidence-based competitive positioning for field conversations

Key Insight: Lead author Dr. Alicia Bertone authored BOTH the Pro-Stride landmark RCT (2014, n=40) AND the equicenta CTM trial (2026, n=138). Same researcher, 3.5× the horses, real-world SOC comparator instead of saline.

What eCTM Beat: Two-thirds of all SOC injections in the trial (67%) were autologous blood-derived therapies — APS, ACS/IRAP, PRP, and A2M. eCTM outperformed them across every measured outcome with markedly fewer injection reactions.

CLINICAL EVIDENCE COMPARISON

Evidence Quality — eCTM vs. Competitors

Product	Best Study	Design	N	Evidence
equicenta CTM	Bertone 2026	Prospective controlled trial	138	Level I–II
Pro-Stride APS	Bertone 2014 (AJVR)	RCT (blinded, placebo)	40	Level II
IRAP / ACS	Weinberger 2008	Retrospective case series	262	Level III
PRP (general)	2025 PRISMA review	Systematic review	11 studies	Level III–IV
VetStem Adipose MSC	VetStem surveys	Owner survey	66	Level III
RenoVo (amnion)	Duddy 2022	Prospective case series	100	Level III
Hilltop Bio	Whitaker/LSU pilot	Unpublished case series	~10	Level IV–V

COST PER OUTCOME

The True Cost of Treatment

Product	Vet Cost	Owner Cost / Tx	Protocol	Annual to Owner	Evidence
equicenta CTM	\$825	\$1,300–\$2,000	Single injection (most cases)	\$1,300–\$2,000	Prospective trial; 2.72× RTP; 4× safer
Maintain	\$374–\$625	\$561–\$1,250	Single injection, periodic	\$1,122–\$3,750 (2–3×/yr)	Leverages eCTM platform
Pro-Stride APS	\$369/kit (\$1,897/6-pk) + centrifuge	\$1,000–\$1,500	2–3 injection series	\$2,000–\$4,500	RCT (n=40); 14 days
IRAP / ACS	~\$200–\$400/processing	\$1,500–\$3,000 (series)	3–4 injection series	\$1,500–\$3,000+	Uncontrolled
VetStem	\$1,200/kit	\$2,000–\$3,500	Harvest + 48-hr processing	\$2,000–\$3,500+	Retrospective: 77% RTW

Product	Vet Cost	Owner Cost / Tx	Protocol	Annual to Owner	Evidence
Cultured Stem Cells	\$2,000–\$3,000 (harvest + lab grow-out)	\$5,000–\$10,000	Surgical harvest + lab expansion	\$5,000–\$10,000	Limited controlled data
Restigen PRP	\$267/kit (\$1,338/6-pk)	\$600–\$900/injection	2–3 injection series	\$1,200–\$2,700 (2–3×)	Heterogeneous; no RCT
Generic PRP kit	\$50–\$150/kit	\$150–\$300/injection	2–3 injection series	\$300–\$900 (2–3×)	Heterogeneous; no RCT
RenoVo	Est. \$300–\$600	\$500–\$1,200	Single injection	\$500–\$1,200	Uncontrolled (conflicted)
Hilltop Bio	~\$367	\$400–\$1,000	Single injection	\$400–\$1,000	No peer-reviewed pubs
Corticosteroid + HA	\$15–\$50 drug cost	\$200–\$500	Repeat q3–6 mo	\$400–\$2,000	Symptomatic only; risk

HANDLING OBJECTIONS

Price Objection Scripts

"It's too expensive compared to PRP / Pro-Stride."

A generic PRP kit costs \$50–\$150 and Restigen runs \$267/kit — but both typically require 2–3 injections. eCTM is a single-injection product backed by a 138-horse controlled trial showing 2.72× return-to-performance odds, sustained to 26 weeks while SOC declined after 12.

"My clients won't pay for a single injection."

At \$825 vet cost, the owner-facing price is about \$1,300–\$2,000 — one injection versus the 2–3 injections ProStride (\$2,000–\$4,500/yr) and PRP require, and far below cultured stem cells (\$5,000–\$10,000).

"I need a bigger discount."

At \$825 vet cost, eCTM already sits below VetStem (\$2,000–\$3,500 to owner), below an IRAP series (\$1,500–\$3,000), and competitive with a full ProStride course — but with a 138-horse prospective controlled trial.

"RenoVo / Hilltop is similar and cheaper."

RenoVo's best study is uncontrolled with conflicted authors; Hilltop has no peer-reviewed publications. eCTM's evidence is a prospective controlled trial with 138 horses and independent, blinded analysis.

CLINICAL EVIDENCE

Clinical Highlights

Bottom line: In the largest controlled clinical trial of its kind — 138 horses, 195 conditions, 8 sites, 11 veterinarians — eCTM outperformed real-world standard-of-care biologics across every measured outcome, in a single off-the-shelf injection, with markedly fewer injection reactions.

- 2.72× return to performance

2.72:1 odds of returning to prior performance level versus standard-of-care biologics (p<0.006).
- 3× more likely to be pain-free

eCTM horses were roughly 3× more likely to be completely pain-free than SOC-treated horses (p<0.001).

Markedly fewer injection reactions SOC biologics had 4.8× the odds of injection reactions on vet review (5.9× central); 3.4× even excluding PAAG (p<0.03).	Durable to 26 weeks eCTM benefits were sustained through 26 weeks, while SOC outcomes declined after the 12-week mark.
One off-the-shelf injection A single thawed 1.5 mL injection in most cases — no harvest, no incubation, no multi-injection series.	First controlled allograft trial in horses The first controlled clinical trial of a tissue allograft in horses — a real-world SOC comparator, not saline.
